Summary

Ovis ammon (wild sheep) are widespread from the Mediterranean to Central Asia and Siberia and several sub-species are known. *Ovis ammon* prefer living in the mountains and high plateaus. Its diet is particularly diverse; consisting of herbs, leaves, buds and the young shoots of trees and shrubs. Sub-species have been introduced to mainland France but also to the Kerguelen Islands (*Ovis ammon* ssp *musimon* Pall.) where they have had a significant impact on native vegetation.

Management information

[Massam M, Kirkpatrick W and Page A., 2010. Assessment and prioritisation of risk for forty introduced animal species. Invasive Animals Cooperative Research Centre, Canberra.](#)

Summary: This report documents work contributing to a project commissioned by the Invasive Animals Cooperative Research Centre to validate and refine risk assessment models used in decisions to import and manage introduced vertebrate species. The intent of the project was to: a) increase predictive accuracy, scientific validation and adoption of risk assessment models for the import and keeping of exotic vertebrates, and b) reduce the risk of new vertebrate pests establishing introduced populations in Australia.

[Page, Amanda; Win Kirkpatrick and Marion Massam, February 2009, Domestic Sheep \(*Ovis aries*\) risk assessment for Australia. Department of Agriculture and Food, Western Australia.](#)

Summary: Models for assessing the risk that exotic vertebrates could establish in Australia have been developed for mammals, birds (Bomford 2003; Bomford 2006, 2008), reptiles and amphibians (Bomford 2006, 2008; Bomford et al. 2005). These Risk Assessment models have been further explored by Western Australia Department of Agriculture & Food (DAFWA) to confirm that they reasonably predict public safety, establishment and pest risks across a full range of exotic species and risk levels. Mammals and birds were assessed for the pest risk they pose if introduced to Australia, by calculating Vertebrate Pests Committee (VPC) Threat Categories. These categories incorporate risk of establishing populations in the wild, risk of causing public harm, and risk of becoming a pest (eg causing agricultural damage, competing with native fauna, etc). The 7-factor Australian Bird and Mammal Model was used for these assessments.
