Common name: rose-ringed Parrakeet (English), ring-necked parakeet (English), Perruche à Collier (French)

Synonym

Similar species

Summary

The rose-ringed parakeet, *Psittacula krameri*, is native to central Africa and Asia and is a colourful, distinctive-looking bird. It is known as one of the most successful avian invaders in the world, with established populations in over 35 countries outside its native range. *P. krameri* has been shown to have adverse impacts on native bird species and carry diseases. It is thought that its reproductive success, establishment and range expansion in non-native areas is related to climate similarities of non-native areas to that of its native range.

Notes

Four subspecies recognised include: *Psittacula krameri borealis* (Neumann, 1915), *Psittacula krameri krameri* (Scopoli, 1769), *Psittacula krameri manillensis* (Bechstein, 1800), *Psittacula krameri parvirostris* (Souance, 1856)

Management Info
Preventative measures: The Bureau of Rural Sciences, Australia, recently developed a risk assessment model (Bomford, 2003) which has been endorsed by the National Vertebrate Pests Committee and may be used as the basis for future exotic species import applications. To assign an exotic species to a threat category, three risk scores are calculated: the risk that (1) an escaped or released individual would harm people, (2) escaped or released individuals would establish a wild free-living population (3) the species would be a pest if a wild population did establish. These three risk scores are then used to assign the exotic species to one of four threat categories: extreme, serious, moderate or low. *Psittacula krameri* has been assigned an **Extreme** threat category for Australia. These animals should not be allowed to enter, nor be kept in any State or Territory. (Special consideration may be given to scientific institutions on a case by case basis.) Any species that has not been assessed previously should be considered to be in the Extreme Threat Category and should be treated accordingly, until a risk assessment is conducted.

Mechanical: Trapping has been conducted in Australia to remove individuals from the wild (Shwartz & Shirley 2007).
