**Common name**
scoiatto grigio (Italian), Grauhoernchen (German), grey squirrel (English), gray squirrel (English)

**Synonym**

**Similar species**

**Summary**
The grey squirrel (*Sciurus carolinensis*) is native to deciduous forests in the USA and has been introduced to the UK, Ireland, Italy and South Africa. In the introduced range grey squirrels damage trees by eating the bark and in Europe they cause the local extinction of red squirrel (*Sciurus vulgaris*) populations through competition and disease.

*view this species on IUCN Red List*

**Species Description**
The grey squirrel (*Sciurus carolinensis*) is a medium-sized tree squirrel with no sexual dimorphism in size or colouration. Ranges of external measurements (in mm) are: total length, 380-525; length of tail, 150-250; length of hind foot, 54-76; length of ear, 25-33. Adult body mass ranges from 300 to 710g. The back is grizzled dark to pale grey and may be washed with cinnamon on hips, feet, and head. Ears are buff to grey to white in the north; tail is white to pale grey. Underparts are white to grey to buff to cinnamon. In the native range of the species in North America melanism is common in the north and albinism is rare (Koprowski, 1994).

**Notes**
Grey squirrels (*Sciurus carolinensis*) cache food in small pits to see them through the winter. They have excellent spatial memory allowing these caches to be relocated.

**Uses**
Grey squirrels (*Sciurus carolinensis*) are harvested for food in Mississippi (USA). Squirrels are popular animals to watch throughout their native and introduced ranges.

**Habitat Description**
Grey squirrels (*Sciurus carolinensis*) survive best in mature deciduous woodland where there is a mixture of nut producing species that produce food that can be stored overwinter. In the UK they are common visitors to urban gardens where they frequently eat food left out for birds.
Reproduction
Placental, sexual. 2-3 young per litter, 1-2 litters per year.

Nutrition
Grey squirrels (*Sciurus carolinensis*) eat nuts, buds, flowers, seeds, fruits, fungi, some insects and occasionally bird eggs. During low food periods, they strip bark to get to inner bast and cambian layers. They also feed on maize if grown close to woodlands.

General Impacts
In overlap areas, the grey squirrel (*Sciurus carolinensis*) causes the extinction of the red squirrel (see *Sciurus vulgaris* in IUCN Red List of Threatened Species*) through competitive exclusion. It can also cause damages to woodland through bark stripping activity, sycamore (*Acer pseudoplatanus*) and beech (*Fagus sylvatica*) are particularly badly affected (Bertolino and Genovesi, 2003). Grey squirrels also act as a reservoir for a poxvirus that red squirrels are affected by. This has been postulated as another reason why red squirrels go extinct in the presence of grey squirrels; a phenomenon known as pathogen-mediated competition (Gurnell et al. 2006). Squirrels can be a garden pest by digging up bulbs and eating the bark of ornamental plants.

Management Info
The Forestry Commission, in the United Kingdom, have a research programme that includes investigating the impact of grey squirrels on woodland biodiversity & identifying efficient control strategies, developing cost effective methods of managing impacts on timber production, developing a decision-support system for woodland managers on targeting grey squirrel control to support sustainable forest management, and promoting and supporting best practice management for the control of grey squirrels and their impacts. Please follow this link for an annual summary of their research

Physical: Physical management of grey squirrels includes bounty payments, free cartridges (for shooting), tail bonuses, and trapping.

Chemical: Warfarin (anti-coagulant) is the only cost-effective method of control currently available.

General information
Summary: English: The species list sheet for the Mexican information system on invasive species currently provides information related to Scientific names, family, group and common names, as well as habitat, status of invasion in Mexico, pathways of introduction and links to other specialised websites. Some of the higher risk species already have a direct link to the alert page. It is important to notice that these lists are constantly being updated, please refer to the main page (http://www.conabio.gob.mx/invasoras/index.php/Portada), under the section Novedades for information on updates.
