Management Info

Preventative measures: A Risk assessment of Prosopis spp., for Australia was prepared by Pacific Island Ecosystems at Risk (PIER) using the Australian risk assessment system (Pheloung, 1995). The result is a score of 20 and a recommendation of: reject the plant for import (Australia) or species likely to be a pest (Pacific).

The Best Practice Manual Mesquite Control and management options for mesquite (Prosopis spp.) in Australia aims to provide the most current information on mesquite in Australia. The control and management options presented in this manual are the combined results of years of trials carried out by many dedicated researchers, landholders, herbicide companies, government officers, landcare groups and others. As mesquite species respond differently to control methods, the most effective method or combination of methods will vary depending on the size, density and species of mesquite present. The manual includes a ‘mesquite control tool box’. Included also are a number of case studies to demonstrate best practice.

**Management information**

**Summary:** This site provides information on the strategy for the management of Mesquite (*Prosopis*). Documents available for download include the strategy, Mesquite control manual, brochures, posters and current and potential distribution maps.  

Belton, T., 2008. *Management Strategy for Mexican Thorn (*Prosopis juliflora*) on Ascension Island. An assessment of this species, and recommendations for management.* Prepared by Tom Belton, Weed Ecologist, SAIS Project, RSPB. This report was produced with the financial assistance of the European Union. The contents are the sole responsibility of RSPB and can under no circumstances be regarded as reflecting the position of the European Union  

IUCN/SSC Invasive Species Specialist Group (ISSG),. 2010. *A Compilation of Information Sources for Conservation Managers.*  
**Summary:** This compilation of information sources can be sorted on keywords for example: Baits & Lures, Non Target Species, Eradication, Monitoring, Risk Assessment, Weeds, Herbicides etc. This compilation is at present in Excel format, this will be web-enabled as a searchable database shortly. This version of the database has been developed by the IUCN SSC ISSG as part of an Overseas Territories Environmental Programme funded project XOT603 in partnership with the Cayman Islands Government - Department of Environment. The compilation is a work under progress, the ISSG will maintain and enhance the database with current and newly published information, reports, journal articles etc.  
**Summary:** Global concern about deforestation caused by fuelwood shortages prompted the introduction of *Prosopis juliflora* to many tropical areas in the 1970s and 1980s. *P. juliflora* is a hardy nitrogen-fixing tree that is now recognised as one of the world’s most invasive alien species. The introduction and subsequent inva­sion of *P. juliflora* in the Lake Baringo area of Kenya has attracted national media attention and contra­dictory responses from responsible agencies. This paper presents an assessment of the livelihood effects, costs of control and local perceptions on *P. juliflora* of rural residents in the Lake Baringo area. Unlike some other parts of the world where it had been introduced, few of the potential benefits of *P. juliflora* have been captured and very few people realise the net benefits in places where the invasion is most ad­vanced. Strong local support for eradication and replacement appears to be well justified. Sustainable utilisation will require considerable investment and institutional innovation  
Osmond, Rachele, 2003. *Best Practice Manual Mesquite Control and management options for mesquite (Prosopis spp.) in Australia.* This manual is sponsored by the National Weeds Program (Natural Heritage Trust) and the Queensland Department of Natural Resources and Mines.
