

Solenopsis papuana

System: Terrestrial

Kingdom	Phylum	Class	Order	Family
Animalia	Arthropoda	Insecta	Hymenoptera	Formicidae

Common name Papuan thief ant (English)

Synonym *Solenopsis cleptis* , Mann
Solenopsis dahlia , Forel
Solenopsis cleptis , var. *vitiensis* Mann

Similar species ,

Summary *Solenopsis papuana* is a native ant of the Pacific region that thrives in the company of other more major invasive ants, but is not a major pest species on its own. It has been introduced to Hawaii and has been able to invade intact forest land.

[view this species on IUCN Red List](#)

Species Description

Solenopsis papuana are very small monomorphic ants. They have a light reddish yellow to medium reddish brown colouration. The total length of workers is around 1-2mm. Antennae are 10-segmented with a 2-segmented club. Eyes are small to medium in size and contain less than 10 ommatidia. The mandibles can have 4 or 5 teeth. The head is subquadrate, and is longer than it is wide. The metanotal groove of this species is distinct and the petiole is higher than the postpetiole. All the dorsal surfaces of *S. papuana* have erect setae. The gaster is oval with the first segment longer than half the total length (Harris *et al.* 2005). Please follow this link for a fully illustrated [Lucid key to common invasive ants \[Hymenoptera: Formicidae\] of the Pacific Island region](#) [requires the most recent version of Java installed]. The factsheet on *Solenopsis papuana* contains an overview, diagnostic features, comparison charts, images, nomenclature and links. (Sarnat, 2008)

Notes

Solenopsis papuana is not known to sting people (Gruner, 2000).

Uses

The mound-building activities of non-native *Solenopsis* spp. alter physical and biogeochemical properties of soils, and can lead to increased soil aeration and infiltrability, elevated soil pH, increased phosphorous and potassium levels, lowered surface soil bulk density, change in organic matter, altered soil texture and enhanced fungal abundance. These influences are further enhanced by plant uptake and excretion in the rhizosphere, and cause other flow-on effects within ecosystems. This is an area that has not been well studied, and more research is warranted (DeFauw *et al.* 2008 and references therein).

Habitat Description

Found in tropical rainforests, *Solenopsis papuana* colonies often nest in soil and are most often associated with rotting wood in or near soil, or under rocks. This species has occasionally been found inhabiting dry forested areas. (Harris *et al.* 2005).

Nutrition

Solenopsis papuana workers form trails to foraging sites but will also forage by spreading over an area (Harris et al. 2005).

General Impacts

Studies have been conducted that suggest a negative interaction between *Solenopsis papuana* and indigenous invertebrates. Authors have suggested that they present a grave threat to native diversity, however arguments have surfaced which suggest the impact might not be as severe as originally thought, but more research is needed before a conclusion can be drawn (Gillespie and Reimer, 1993; Wetterer, 2002). *S. papuana* is an inconspicuous species (Wilson & Taylor 1967) whose arrival could go unnoticed (Harris et al. 2005).

Management Info

Preventative measures: [The Pacific Ant Prevention Programme](#) is a proposal prepared for the Pacific Plant Protection Organisation and Regional Technical Meeting for Plant Protection. This plan aims to prevent the red imported fire ant and other invasive ant species with economic, environmental or social impacts from establishing within or spreading between countries in the Pacific.

Chemical Amdro® (hydramethylnon) is very effective at controlling *S. papuana*'s relative, *S. invicta*. Presto® (fipronil) and Xstinguish® (fipronil) also appear to be highly effective baits for *S. invicta* and would most likely be effective against *S. papuana*. Engage® (methoprene) and Distance® (pyriproxyfen) are insect growth regulators (IGR) that were manufactured in Australia to combat *S. invicta*. These two chemicals may be viable control options for *S. papuana* (Stanley, 2004). Gruner (2000) found that *S. papuana* was abundant on peanut butter baits in Hawai'i.

Please follow this link for more detailed information on the [management of *Solenopsis papuana*](#) compiled by the ISSG.

Pathway

S. papuana is predominantly reported as live workers associated with taro and coconut imports (Harris and Berry, 2005).

Managment information

Harris, R.; Abbott, K.; Barton, K.; Berry, J.; Don, W.; Gunawardana, D.; Lester, P.; Rees, J.; Stanley, M.; Sutherland, A.; Toft, R. 2005: *Invasive ant pest risk assessment project for Biosecurity New Zealand. Series of unpublished Landcare Research contract reports to Biosecurity New Zealand. BAH/35/2004-1.*

Summary: The invasive ant risk assessment project, prepared for Biosecurity New Zealand by Landcare Research, synthesises information on the ant species that occur in New Zealand (native and introduced species), and on invasive ants that pose a potential threat to New Zealand.

There is a great deal of information in this risk assessment on invasive ant species that is of global interest, including; biology, distribution, pest status, control technologies.

The assessment project has five sections. 1) The Ants of New Zealand: information sheets on all native and introduced ants established in New Zealand 2) Preliminary invasive ant risk assessment: risk scorecard to quantify the threat to New Zealand of 75 ant species. 3) Information sheets on invasive ant threats: information sheets on all ant species scored as medium to high risk (n = 39). 4) Pest risk assessment: A detailed pest risk assessment for the eight species ranked as having the highest potential risk to New Zealand (*Anoplolepis gracilipes*, *Lasius neglectus*, *Monomorium destructor*, *Paratrechina longicornis*, *Solenopsis geminata*, *Solenopsis richteri*, *Tapinoma melanocephalum*, *Wasmannia auropunctata*) 5) Ranking of high risk species: ranking of the eight highest risk ant species in terms of the risks of entry, establishment, spread, and detrimental consequences.

NB. The red imported fire ant (*Solenopsis invicta*) is considered to be the worst ant pest in the world. However, *Solenopsis invicta* was specifically excluded from consideration in this risk assessment as this species has already been subject to detailed consideration by Biosecurity New Zealand

(This invasive ant pest risk assessment was funded by Biosecurity New Zealand and Foundation for Research, Science and Technology. Undertaken by Landcare Research in collaboration with Victoria University of Wellington and Otago Museum)

This plan aims to prevent the red imported fire ant and other invasive ant species with economic, environmental and/or social impacts, entering and establishing in or spreading between (or within) countries of the Pacific Region.

[Sarnat, E. M. \(December 4, 2008\) PIAkey: Identification guide to ants of the Pacific Islands, Edition 2.0, Lucid v. 3.4. USDA/APHIS/PPQ Center for Plant Health Science and Technology and University of California Davis.](#)

Summary: PIAkey (Pacific Invasive Ant key) is an electronic guide designed to assist users identify invasive ant species commonly encountered in the Pacific Island region. The guide covers four subfamilies, 20 genera and 44 species.

The primary tool offered by PIAkey is an interactive key designed using Lucid3 software. In addition to being fully illustrated, the Lucid key allows users to enter at multiple character points, skip unknown characters, and find the most efficient path for identifying the available taxa. Each species is linked to its own web page. These species pages, or factsheets, are linked to an illustrated glossary of morphological terms, and include the following seven sections: 1) Overview of the species; 2) Diagnostic chart illustrating a unique combination of identification characters; 3) Comparison chart illustrating differences among species of similar appearance; 4) Video clip of the species behavior at food baits (where available); 5) Image gallery that includes original specimen images and live images (where available); 6) Nomenclature section detailing the taxonomic history of the species, and 7) Links and references section for additional literature and online resources.
