

Dalbergia sissoo 简体中文 正體中文

System: Terrestrial

Kingdom	Phylum	Class	Order	Family
Plantae	Magnoliophyta	Magnoliopsida	Fabales	Fabaceae
Common name	sisuitti (Tamil), gette (Tamil), sisu (Spanish), dalbergia (Arabic), shinshapa (Sanskrit), sisso (Tamil), nukku kattai (Tamil), Indian dalbergia (English), pradu-khaek (Thai), yette (Tamil), du-khaek (Thai), Himalaya raintree (English), tali (English), skuva (English), India teakwood (English), ostindisches Rosenholz (German), aguru (Sanskrit), shishu (Bengali), Bombay blackwood (English), Indian rosewood (English), sissau (Nepali), sisso (English), sisham (Nepali), sisam (Hindi), shisham (Hindi), shisu (Bengali), sisu (Bengali), sonoswaseso (Javanese), sissu (Hindi), sissai (Hindi), pradu-khaek (Indonesian Bahasa), du-khaek (Indonesian Bahasa), ébénier juane (French)			
Synonym	Amerimnon sissoo , (Kuntze) Dalbergia pseudo-sissoo , (Miq.)			
Similar species				
Summary	<i>Dalbergia sissoo</i> is a perennial tree that is economically important for its value in forestry, agroforestry, and horticulture. It provides timber, fuelwood, fodder, has medicinal value, used extensively as an ornamental tree as well as for shading, erosion control, and soil fertility. Native to the Indian sub-continent it is a member of the legume family and can fix nitrogen from the atmosphere through bacteria nodules on its root system. It has been introduced in various countries throughout the world, but has known to be invasive in Australia and in Florida (U.S.).			
CEP	view this species on IUCN Red List			

Species Description

Dalbergia sissoo is a decidious tree with an open spreading crown that reaches a height between 15-35 metres (Duke, 1983). The trunk is often crooked (Duke, 1983) with thin, grey bark, furrowed and exfoliating in narrow strips as it matures (ICRAF, undated). It has a long taproot and an extensive lateral root system, often at the soil surface and producing suckers (PIER, 2006). The leaves are alternately arranged, compound and oddly pinnate (Gilman & Watson, 1993), with 3-5 glabrous, leathery leaflets, elliptical to ovate, tapering to a point and 2.5-3.6cm in diameter (ICRAF, undated). Flowers are sessile (PIER, 2006), arranged in axillary panicles, 2.5-3.7cm long, inconspicuous, white to dull yellow (ICRAF, undated). Flowers are fragrant (PIER, 2006), with pubescent sepals 4-5mm long, and petals 6-8mm long (Duke, 1983). Fruits are indehiscent, 5-7.5cm long and 8-13mm wide (ICRAF, undated), rounded with minute points, pale brown in colour (PIER, 2006), and persistent on the tree (Gilman & Watson, 1993). The seed is kidney-shaped, thin, flat, and light brown with 1-4 seeds in a pod (ICRAF, undated).

Notes

Dalbergia sissoo has many beneficial impacts to the environment. Its extensive root system makes it ideally suited for stabilizing and controlling erosion along distrubed areas and near rivers and streams (ICRAF, undated, Duke, 1983). Belonging to the family Fabaceae, *D. sissoo* has the ability to fix nitrogen from the atmosphere through bacteria located in nodules present in the root system of the plant (ICRAF, undated). The leaf litter that accumulates and decomposes also contributes to soil fertility by adding additional nitrogen, potassium, iron, manganese, and organic carbon (Sangha & Jalota, 2005). In studies done in comparison of native *D. sissoo* species planted in monocultures versus exotic *Eucalyptus tereticornis* monocultures, plant species diversity was much higher in *D. sissoo* monocultures than in the *E. tereticornis*(Sangha & Jalota, 2005). In its native range indian rosewood is a host to a variety of species of orchids (ICRAF, undated).

Lifecycle Stages

Dalbergia sissoo begins to produce flowers after nine months, with flowering closely associated with leaf flush in the spring (ICRAF, undated), April-May in North America(Painter, 2006). The mature pods are persistent on the tree for 7-8 months (ICRAF, undated), however seed remains viable for a few months once exposed to air (Sheikh, 1989). The seed germinates in the spring in 1-3 weeks (Sheikh, 1989). Trees reach maturity around 19-21 years of age (Sangha & Jalota, 2005) with a natural rotation of about 60 years (Sharma, *et al*, 2000).

Uses

Dalbergia sissoo has a wide range of economic and ecological uses. The wood of Indian rosewood is highly durable with excellent finishing colour and smoothness; used for veneer, furniture, cabinets, panelling, carving, small timber, plywood and musical instruments (ICRAF, undated; Lowry & Seebeck, 1997). The sawdust works in the absorption of nickel ions and has the potential of removing these heavy metals from industrial and commercial waste water sources (Habib-ur-Rehman,*et al*, 2006). The wood has a high caloric content and is an important fuelwood and charcoal source (Sheikh, 1989). The wood fibres are processed into a pulp that is further made into paper (ICRAF, undated). A non-drying fixed oil is processed from the heartwood and used as a lubricant in heavy machinery (ICRAF, undated). The leaves and young shoots can be used as fodder for livestock and grazing animals typically in winter seasons when other fodder is not available (Sheikh, 1989). The tree has many reputed medicinal properties and have been used culturally for a variety of ailments including: skin diseases, blood diseases, syphilis, stomach problems, dysentry, nausea, eye and nose disorders, aphrodisiac, expectorant, among others (Duke, 1983). Indian rosewood also has insecticidal and larvicidal properties, as well as resistance to some wood boring insects (ICRAF, undated).

Ecologically Indian rosewood provides numerous servives to the landscape and environment and is commonly employed in agroforestry (Lowry & Seebeck, 1997). It is used as a windbreak and shelter belt and as a shade tree in intercropping of orchards, mango, tea, and coffee plantations (ICRAF, undated; Sharma,*et al*, 2000). Since it has an aggressive root system and is prone to suckering it is commonly used for erosion control and soil stabilization along stream and river banks (ICRAF, undated). It is widely planted in its native countries for reforestation programs (Sharma,*et al*, 2000). It is also valued for its ability to increase soil fertility through nitrogen fixation and is intercropped for these reasons as well (ICRAF, undated). Highly valued for its fragrant flowers and shade it is planted in urban areas along roadsides and in gardens as an ornamental (Gilman & Watson, 1993).

Habitat Description

Dalbergia sissoo is found in tropical to subtropical climates in natural and planted forests, mainly along forest margins near streams and rivers, hammocks, canopy gaps, agricultural areas, disturbed sites and roadsides (ICRAF, undated; Langeland & Stocker, 2001; Duke, 1983; Sharma, et al, 2000). It survives in areas with a mean annual rainfall of 500-4500mm and often associated with seasonal monsoon and periods of drought up to six months (ICRAF, undated). Temperature hardiness is from slightly below freezing to 50 degrees Celsius (Sheikh, 1989) and can grow from altitudes ranging at sea-level to 1500 metres (ICRAF, undated). It grows best in porous well-drained soils like sands, sandy loams, gravels, and alluvial soils, but does poorly in heavy clay and waterlogged soils (Sharma, et al, 2000). The pH ranges from 5-7.7(ICRAF, undated) and the species has a low salt tolerance (Black & Meerow, 1993). Seedlings are intolerant of shade (Sheikh, 1989) but mature trees can tolerate moderate shade (Black & Meerow, 1993).

Reproduction

Dalbergia sissoo reproduces through seed production and vegetatively through suckers arising from the root system (PIER, 2006). The flowers are bisexual and capable of both self- and cross-pollination (ICRAF, undated). The pollination mechanism is theorized to be through insects (ICRAF, undated). Regeneration is rare under the shade of the parent canopy and seed dispersal is through wind or water (ICRAF, undated).

General Impacts

Literature on the effects of *D. sissoo* in introduced natural or wilderness areas is limited.

Management Info

<u>Preventative measures</u>: Preventing the introduction through strict quarantine and inspection stations is the primary preventative measure. Education of the public on identity, impact, and control of the species is necessary to ensure public support for keeping the species from being introduced. Research and testing on what kind of impact and what invasion potential the species has on the environment will determine if the species can be safely cultivated in the country (Langeland & Stocker, 2001).

<u>Chemical</u>: Herbicide applications to the base of the trunk of *D. sissoo* is recommended in Florida for control (Langeland & Stocker, 2001). Other chemical applications can be made on the cut stump, basal bark or as a stem injection (PIER, 2006).

<u>Biological</u>: There is no mention in the literature of a host specific organism that is being researched or tested as a biological control agent for *D. sissoo*, however several species of fungi, insect, and bacteria cause mortality or reduced growth of the tree. Species of fungi that attack and commonly kill Indian rosewood are the genus *Fusarium, Ganoderma lucidum,* and *Phellinus gilvus,* all of which attack the root and vascular system (Sharma,*et al,* 2000). Several defoliating moths, *Plecoptra reflexa* and *Dichomeris eridantis* can cause significant biomass reduction in Indian rosewood (Sharma,*et al,* 2000). Other insect species that attack indian rosewood are *Stromartium barbatum, Sinoxylon anale,* and *Lyctus africanus* (Sheikh, 1989).
