Summary

Heteropogon contortus is a thick, fast growing perennial grass, whose stems reach 1.2 meters high. A native of South Africa, southern Asia, northern Australia and Oceania, it has become a weed in the tropics and subtropics of the American continent and in east Asia. It is abundant in regions where rainfall is less than 800mm. Rarely cultivated, it grows spontaneously wherever grasslands suffer from seasonal fires. It resists fire very well and can lead to the formation of savannahs.
