Plantae	Magnoliophyta	Magnoliopsida	Fabales	Fabaceae

mesquite (English), honey mesquite (English), Texas mesquite (English), Common name

Mesquite-Busch (German)

Synonym

Similar species

Summary Prosopis glandulosa (mesquite) is a perennial, woody, deciduous shrub or

small tree. It forms impenetrable thickets that compete strongly with native species for available soil water, suppress grass growth and may reduce

understory species diversity.

view this species on IUCN Red List

Species Description

Multi-stemmed shrub, branches with zigzag shape. Bipinnate leaves generally dark green but can be bluish green, leaflets 5-15 times as long as broad (20mm long). Flowers are yellow and grouped in dense drooping \"lamb's tail\" spikes. Seed pods bean-like (10-20cm long) with slight constrictions. Spines above axillary bud.

Notes

Occurs over climatically diverse regions, grows well on all soil types. Thrives in high temps >38°C. Moderate frost tolerance. Moderate salt tolerance. Pods high in sugar (16%) and protein (12%) and so are sought by animals.

Lifecycle Stages

Seeds viable 2-50 years. Maturity 2-5 years. Flowering commences in summer. Seeds mature 35-40 days after flowering. Plants may be deciduous. Seeds germinate after warm temperatures and rain, these conditions may occur only sopradically. Spread facilitated by grazing animals.

Habitat Description

Occurs over climatically diverse regions, grows well on all soil types. Thrives in high temps >38°C. Moderate frost tolerance. Moderate salt tolerance. Pods high in sugar (16%) and protein (12%) and so are sought by animals.

Reproduction

Seed production and suckering (dormant buds below the ground, stimulated by disturbance). 10's of thousands of seeds per square metre per year, seedling mortality high less than 800 seedlings per hectare after one year

Nutrition

No signficance nutrient requirements.

General Impacts

Rapidly outcompetes understorey plants resulting in complete loss of grass cover. Erosion is exacerbated by allelopathic affects of ground litter.

Management Info

Preventative measures: A Risk assessment of *Prosopis* spp. for Australia was prepared by Pacific Island Ecosystems at Risk (PIER) using the Australian risk assessment system (Pheloung, 1995). The result is a score of 20 and a recommendation of: reject the plant for import (Australia) or species likely to be a pest (Pacific). The Best Practice Manual Mesquite Control and management options for mesquite (*Prosopis* spp.) in Australia aims to provide the most current information on mesquite in Australia. The control and management options presented in this manual are the combined results of years of trials carried out by many dedicated researchers, landholders, herbicide companies, government officers, landcare groups and others. As mesquite species respond differently to control methods, the most effective method or combination of methods will vary depending on the size, density and species of mesquite present. The manual includes a 'mesquite control tool box'. Included also are a number of case studies to demonstrate best practice.

Mwangi, Esther & Brent Swallow., 2008. *Prosopis juliflora* Invasion and Rural Livelihoods in the Lake Baringo Area of Kenya. Conservation & Society Year: 2008, Volume: 6 Issue: 2 Page: 130-140

Summary: Global concern about deforestation caused by fuelwood shortages prompted the introduction of *Prosopis juliflora* to many tropical areas in the 1970s and 1980s. *P. juliflora* is a hardy nitrogen-fixing tree that is now recognised as one of the world's most invasive alien species. The introduction and subsequent inva\(\epsilon \) ion of *P. juliflora* in the Lake Baringo area of Kenya has attracted national media attention and contra\(\epsilon \) dictory responses from responsible agencies. This paper presents an assessment of the livelihood effects, costs of control and local perceptions on *P. juliflora* of rural residents in the Lake Baringo area. Unlike some other parts of the world where it had been introduced, few of the potential benefits of *P. juliflora* have been captured and very few people realise the net benefits in places where the invasion is most ad\(\epsilon \) vanced. Strong local support for eradication and replacement appears to be well justified. Sustainable utilisation will require considerable investment and institutional innovation
