Synonym *Hibiscus abelmoschus*, L.

Similar species

Summary *Abelmoschus moschatus* is a weedy, herbaceous plant that is native to India, parts of China and tropical Asia, and some Pacific islands. It is cultivated in India for the musk-like oil contained in its seeds, which is valued for perfume manufacture. It is considered a weed in open and disturbed areas. It has been found to be a suitable host plant for the insect *Dysdercus cingulatus*, which is a serious pest of cotton crops.

[view this species on IUCN Red List](#)

Species Description

Abelmoschus moschatus is an herbaceous trailing plant that grows to 2m in diameter with soft, hairy stems. It can grow up to 1.5m tall. Leaves are alternate, rough, hairy and heart-shaped. They have 3 to 5 lobes and can grow to 15cm long. Flowers resemble those of the hibiscus and are usually watermelon pink, although they are sometimes white or cream in colour. They last for only one day and their flowering depends on the timing of the wet season. Seeds are contained within hairy capsules up to 8cm long, which are tough but papery. A delicate musk-like odour is produced by the seed coat. (Mishra et. al, 2000; PIER, 2003; Townsend, 2000).

Lifecycle Stages

Annual or biennial (Oudhia, 2001).

Uses

Oil obtained from seeds possesses a musk-like odour that is used in the perfume industry. The roots, seeds and sometimes leaves, are used in traditional Indian medicines for a variety of illnesses, including intestinal complaints, constipation, dyspepsia and gonorrhea (Oudhia, 2001). Valued as an ornamental plant due to its colourful and attractive flowers (Magnolia Gardens Nursery, 2004).

Habitat Description

Abelmoschus moschatus grows in a range of habitats, from marshy areas to forest edges, at elevations of up to 450m. Commonly found in disturbed, open areas, as well as gardens, plantations and ricefields (PIER, 2003). Is able to grow on salt-affected wastelands (Mishra & Naik, 2000).

Reproduction

Propagation can be from seeds, small tubers, or stem cuttings (Townsend, 2000).

General Impacts

Considered a weed in open and disturbed areas (PIER, 2003). Found to be a suitable host species for *Dysdercus cingulatus*, a serious pest of cotton crops (Kohno & Ngan, 2004).

Pathway

Cultivated for aromatic oil from seeds.
