

Dichrostachys cinerea  简体中文 正體中文

System: Terrestrial

Kingdom	Phylum	Class	Order	Family
Plantae	Magnoliophyta	Magnoliopsida	Fabales	Fabaceae

Common name sickle bush (English, South Africa), Kalahari-Weihnachtsbaum (German), el marabu (English, Cuba)

Synonym

Similar species

Summary

Dichrostachys cinerea is a thorny, fast-growing woody bush or treelet which invades fields, wasteland, road sides and other disturbed areas. Originally from Africa, it has been introduced to the West Indies during the 19th century. Adult plants live a very long time, producing seeds which survive for a long time in the soil almost all year long. *D. cinerea* causes losses in agricultural production and its management involves frequent, heavy and expensive work.

[view this species on IUCN Red List](#)

Species Description

Bush or treelet 1.5-6m high. Branches bearing short, thorn-ended twigs. Leaves bipinnate, 3-10cm long, with 5-10 pairs of pinnae, each one with 10-30 pairs of folioles 3-6mm long. Spikes 3-8cm long, upper florets sulphur-yellow or yellow, the basal ones neutral, with long lilac-pink staminodes. Pods crowded, glomerate, undulate and contorted, dark brown. Seeds obovate, dark brown, 4mm long.

Lifecycle Stages

Seeds survive long in the soil. The growth of the plants is very fast. Young plants may produce seeds. Adult plants can survive a very long time, producing seeds almost all year long.

Reproduction

Seeds, root cuttings, root suckering.

Each plant produces a large number of seeds per year, almost all year long.

General Impacts

Causes losses in agricultural production. Management involves frequent, heavy and expensive work.

Management Info

Preventative measures: A [Risk Assessment of *Dichrostachys cinerea*](#) for Hawai'i and other Pacific islands was prepared by Dr. Curtis Daehler (UH Botany) with funding from the Kaulunani Urban Forestry Program and US Forest Service. The alien plant screening system is derived from Pheloung *et al.* (1999) with minor modifications for use in Pacific islands (Daehler *et al.* 2004). The result is a score of 16 and a recommendation of: \"Likely to cause significant ecological or economic harm in Hawai'i and on other Pacific Islands as determined by a high WRA score, which is based on published sources describing species biology and behaviour in Hawai'i and/or other parts of the world.\"

Physical: Cutting and burning of the plants is not a very efficient control method, since the seeds survive in the soil, and the growth is very fast.

Chemical: Use of dangerous herbicides is often necessary.
