

Gonipterus scutellatus

System: Terrestrial

Kingdom	Phylum	Class	Order	Family
Animalia	Arthropoda	Insecta	Coleoptera	Curculionidae

Common name gorgojo del eucalipto (Spanish), eucalyptus snout beetle (English), eucalyptus weevil (English), gum tree weevil (English), Eukalyptusrüssler (German)

Synonym

Similar species *Gonipterus gibberus*

Summary *Gonipterus scutellatus*, or the eucalyptus snout beetle, is native to Australia. It is specific to *Eucalyptus* species, and *G. scutellatus* is considered to be one of the major defoliators of *Eucalyptus* spp. worldwide. It causes damage to eucalyptus in both larval and adult stages, in particular to the young leaves and repeated defoliation by *G. scutellatus* can lead to tree death. However, the egg parasitoid *Anaphes nitens* has been introduced as a successful biological control agent in several countries.

Species Description

Please see PaDIL (Pests and Diseases Image Library) Species Content Page Beetles: [eucalyptus snout beetle *Gonipterus scutellatus* Gyllenhal, 1833 \(Coleoptera: Curculionidae: Entiminae\)](#) for high quality diagnostic and overview images.

Notes

Notes on taxonomy and nomenclature: a third species, *Gonipterus platensis* Marelli, was described in Argentina and said to be different from both *G. gibberus* and *G. scutellatus* (Marelli, 1927). Rosado-Neto (1993) treats it as a synonym of *G. scutellatus* (from EPPO, 2005).

Habitat Description

The only hosts are *Eucalyptus* spp., of which the most susceptible are *Eucalyptus camaldulensis*, *Eucalyptus globulus*, *Eucalyptus maidenii*, *Eucalyptus punctata*, *Eucalyptus robusta*, *Eucalyptus smithii* and *Eucalyptus viminalis* (Griffith, 1959 in Walker 2008).

General Impacts

Feeding by *Gonipterus* spp. leads to characteristically scalloped leaf edges, with a resultant dieback of shoot tips and development of tufts of epicormic shoots (Walker 2008). *G. scutellatus* are important defoliators of *Eucalyptus* spp. Trees become stunted and may split and die.

Management Info

The mymarid solitary-egg parasitoid *Anaphes nitens*, an Australian native, has been used as a successful biocontrol agent against *G. scutellatus* in several countries. These include Brazil, Chile, Mauritius, New Zealand, South Africa, Spain and the United States. *A. nitens* larvae feed directly on and from within *G. scutellatus* host eggs. (Hanks *et al.* 2000; Santolamazza-Carbone *et al.* 2009; Wilcken *et al.* 2008; Williams *et al.* 1951; Withers 2001).

Chemical methods are not recommended for control of *G. scutellatus* as honey bees are frequent visitors of *Eucalyptus* spp. during its long flowering season. (EPPO 2005).

G. scutellatus is listed as an A2 quarantine pest for the European and Mediterranean Plant Protection Organisation (EPPO), and it is regulated by most EPPO countries, particularly the EU. *Eucalyptus* species introduced into endangered countries in form of plant or cuttings must originate from a pest-free area, or the plants must be free of soil, and treated for *G. scutellatus*. (EPPO 2005).

Pathway

Larvae and/or pupae may be present in soil. (EPPO 2005). Transportation of host. Larvae and/or pupae may be present in soil. (EPPO 2005). On clothing/footwear, hikers' clothes/boots - when disturbed, adult *Gonipterus scutellatus* readily drop from tree branches and cling to whatever they land on. (Hanks *et al.* 2000).

Transportation of wood. (Wilcken *et al.* 2008). May be present on plants/plant material. (EPPO 2005).

Wilcken, C. F.; de Oliveira, N. C.; Sartorio, R. C.; Loureiro, E. B.; Bezerra Junior, N.; Rosado Neto, G. H., 2008. *Gonipterus scutellatus* Gyllenhal (Coleoptera: Curculionidae) occurrence in *Eucalyptus* plantations in Espirito Santo State Brazil. *Arquivos do Instituto Biologico Sao Paulo*. 75(1). JAN-MAR 2008. 113-115.

Summary: The eucalyptus snout beetle *Gonipterus scutellatus* Gyllenhal was found in Espirito Santo State, Brazil, attacking clonal plantations of *Eucalyptus urophylla* x *E. grandis* (hybrid *Eurograndis*). The presence of this species in Brazil has been known since 1979, with a geographical distribution restricted to Brazil's South and São Paulo State. The pest's introduction to the state of Espírito Santo was probably accidental and its occurrence has been limited to the central region of the state. Field surveys did not detect the egg parasitoid *Anaphes nitens* (Hymenoptera: Mymaridae), which is the main natural enemy of *G. scutellatus*.
