

Azolla pinnata [简体中文](#) [正體中文](#)

System: Terrestrial

Kingdom	Phylum	Class	Order	Family
Plantae	Pteridophyta	Filicopsida	Hydropteridales	Azollaceae

Common name mosquito fern (English), ferny azolla (English), water velvet (English)

Synonym

Similar species *Azolla* spp.

Summary *Azolla pinnata* can spread rapidly, and has the ability to survive on moist soil in and around rivers, ditches, and ponds. It forms dense surface mats, which degrade water quality by reducing oxygen levels, and can interfere with boating, fishing and recreational activities.

[view this species on IUCN Red List](#)

Species Description

"Plants small, 1.5 - 2.5cm long, with a more or less straight main axis with pinnately arranged side **branches**, progressively longer towards the base, thus roughly triangular in shape, the basal branches themselves becoming pinnate and eventually fragmenting as the main axis decomposes to form new plants. Roots with fine lateral rootlets, having a feathery appearance in the water. **Leaves** minute, 1 -2mm long, overlapping in 2 ranks, upper lobe green, brown green or reddish, lower lobe translucent brown; minute, short, plae, +/- cylindrical unicellular hairs often present on the upper lobes. When fertile, round **sporocarps** 1 - 1.5mm wide can be seen on the under side at the bases of the side branches. The leaves often have a maroon-red tinge and the water can appear to be covered by red velvet from the distance. The upper surface of the leaves are totally water-repellant, and if completely submerged the plants quickly refloat with the right side up."

Uses

Azolla is useful as a "soybean plant in rice field", because it can assimilate atmospheric nitrogen gas owing to the nitrogen fixation by cyanobacteria (blue green alga) living in the cavities located at the lower side of upper (dorsal) lobes of leaf. (Duke)

Habitat Description

It has the ability to survive on moist soil in and around rivers, ditches, and ponds which may allow the plant to survive low water levels and periods of drought. (NC Aquatic Fact Sheet)

Reproduction

Generally it multiplies vegetatively, and by spores. In the right conditions *A. pinnata* can double its biomass in 5 to 10 days in the field. (Duke)

Nutrition

Azolla species can often grow on nitrogen poor water due to nitrogen fixing ability. However will grow very rapidly in high nitrogen habitats.

General Impacts

Azolla pinnata can spread very quickly forming dense vegetative masses on areas of still water. This in turn limits light available to other aquatic plants and oxygen used by other aquatic life. It forms dense mats that choke out other species. *A. pinnata* is on the US noxious weed list. In New Zealand has replaced a native floating fern, *Azolla rubra*, over most of northern New Zealand. *Azolla* lives in symbiosis with blue-green algae (cyanobacteria), taking advantage of their ability to fix nitrogen. It is sometimes introduced and used by farmers as a natural fertilizer for this reason.

Management Info

Chemical: [Fact sheet](#) on control of *Azolla* from Queensland, Australia, DNR.

Biological: There was some success in management of *A. pinnata* using weevils in South Africa although the study was aimed primarily at *Azolla filiculoides*.

Pathway

Possible introduced to New Guinea with cattle. *Azolla* lives in symbiosis with blue-green algae (cyanobacteria), taking advantage of their ability to fix nitrogen. It is sometimes introduced and used by farmers as a natural fertilizer for this reason. (PIER, 2003)

Champion, P.D.; Clayton, J.S. 2001. *Border control for potential aquatic weeds. Stage 2. Weed risk assessment. Science for Conservation 185. 30 p.*

Summary: This report is the second stage in the development of a Border Control Programme for aquatic plants that have the potential to become ecological weeds in New Zealand. Importers and traders in aquatic plants were surveyed to identify the plant species known or likely to be present in New Zealand. The Aquatic Plant Weed Risk Assessment Model was used to help assess the level of risk posed by these species. The report presents evidence of the various entry pathways and considers the impact that new invasive aquatic weed species may have on vulnerable native aquatic species and communities.
