Felis catus was domesticated in the eastern Mediterranean c. 3000 years ago. Considering the extent to which cats are valued as pets, it is not surprising that they have since been translocated by humans to almost all parts of the world. Notable predators, cats threaten native birdlife and other fauna, especially on islands where native species have evolved in relative isolation from predators.

Species Description
Felis catus is a small animal in the wild (up to 5kg, but more commonly 1.5 -3.0kg) but may be considerably heavier when domesticated. Colour is extremely variable in domesticated varieties and feral cats commonly revert to black, tabby or tortoiseshell with varying extents of white starting from the belly and breast.

Lifecycle Stages
Gestation: 65 days. Weaning: 35-40 days. Sexual maturity: 9 months.

Habitat Description
Feral cats adapt to a variety of habitat types and circumstances. On the Australian continent they inhabit forests and woodland habitats in eastern, western and northern parts of the country (Dickman 1996). On Hahajima Island, Japan, feral cats have been observed widely in various kinds of habitats, including primary forests (Kawakami and Higuchi 2002). On Macquarie Island, (a sub-Antarctic Australian island) most cats live in herbfield or tussock grassland (Brothers Skira and Copson 1985), showing an ability to adapt to difficult terrain. A study of the habitat use and diet of feral cats in a Mediterranean habitat in a riparian reserve in central California (Hall et al. 2000, in Brickner 2003) can probably reflect on the situation in other areas with similar climatic areas. Cats in the reserve seemed to strongly prefer staying in riparian habitat. Hall and colleagues (2000) suggest that this habitat provides ample cover and perhaps a variety of prey, especially birds. Cats in the study foraged mostly in the adjacent fields and annual grasslands and, to a lesser extent, in the riparian habitat (in Brickner 2003).
Reproduction
Domestic cats are intensive breeders, maybe due to the seasonal estrous cycle of the females, during which each female comes into heat several times until pregnancy or end of cycle (Gunther and Terkel 2002, in Brickner 2003). A female cat reaches reproductive maturity between 7 to 12 months of age can be in estrous as many as five times a year (Ogan and Jurek 1997, in Brickner 2003). The gestation period lasts 63 to 65 days (Nowak 1991, in Brickner 2003) and the average litter is four to six kittens (O’Donnell 2001, in Brickner 2003). Cats can reproduce any month of the year, where food and habitat is sufficient. An adult female may produce three litters per year (Fitzwater 1994, in Brickner 2003).

Nutrition
Male and female feral cat home ranges overlap (Say and Pontier 2004). The mean home range for feral cats in Hawaiian forests was 5.74km² for males and 2.23km² for females (Smucker et al. 2000). Australian studies have given mean home ranges of 7 to 28 hectares for domestic cats and up to 249.7 hectares for feral cats; while a New Zealand study posted home ranges of between 75 hectares and 985 hectares. Prey availability is a primary factor in determining home range size for feral cats (Edwards et al. 2001; Barratt 1997). Cat activity is bimodal, with peaks near dawn and dusk (Konecny 1987).

The diet of feral cats on islands may vary significantly to that of feral cats on the mainland, with cats often taking advantage of alternative food sources. On the tiny 28 hectare Herekopare Island, New Zealand, for example, there are no introduced or native species of mammals. Prior to elimination of feral cats there in 1970, fairy prion (see *Pachyptila turtur* in IUCN Red List of Threatened Species) comprised the bulk of the diet with other sea birds and occasional land birds making up most of the remainder (Fitzgerald and Veitch 1985, in Dickman 1996). The weta (a native insect in the order Orthoptera) also appeared to be important to individual cats; two cats’ stomachs were found to contain over 100 insects each. Similarly, in the Galapagos Islands, birds are an important component of the feral cat’s diet, with cats sometimes taking birds of similar mass to themselves, such as frigate birds (*Fregata* spp.), pelicans (*Pelecanus* spp.) and flightless cormorants (*Phalacrocorax* spp.) (Konecny 1987, in Dickman 1996). On Aldabra Atoll, Seychelles, hatchlings of the green turtle (see *Chelonia mydas* in IUCN Red List of Threatened Species) are seasonally predominant in the diet of feral cats (Seabrook, 1989). On Christmas Island, the introduced black rat (*Rattus rattus*) comprises almost one third of the diet of feral cats by weight, however, 21% of the diet is comprised of the large flying-fox (see *Pteropus melanotus* in IUCN Red List of Threatened Species) and 28% of the imperial pigeon (see *Ducula whartonii* in IUCN Red List of Threatened Species) (Tidemann et al. 1994, in Dickman 1996).
General Impacts
The most obvious impact of feral cats is the predatory impact they exert on native prey populations; this has resulted in the probable local or regional decline or extinction of many species (Dickman 1996). However, unambiguous evidence of cats causing a decline in a prey species is difficult to find as other factors, such as other predator species, may also be involved in the decline (Dickman 1996). One exception to this is a study by Saunders (1991) which showed that cats killed 7% of nestlings of red-tailed cockatoos (Calyptorhynchus magnificus) over 11 breeding seasons in Western Australia. Several reintroduction programmes in Australia have failed, due to the predation pressure exerted by feral cats, often in conjunction with foxes. For example, the success of the reintroductions of the golden bandicoot (Isoodon auratus) and the burrowing bettong (Bettongia lesueur) in the Gibson Desert, Western Australia was hindered primarily by feral cat predation. In general, the predatory impact of cats primarily affects birds and small to medium-sized mammals (Dickman 1996). Endangered species around the world are threatened by the presence of cats, including the black stilt (see Himantopus novaeseelandiae in the IUCN Red List of Threatened Species) (New Zealand), the Okinawa woodpecker (see Sapheopipo noguchii in IUCN Red List of Threatened Species) (Japan) and the Cayman Island ground iguana (see Cyclura lewisi in IUCN Red List of Threatened Species), to list just some of the many species affected.

Changes in island fauna after the introduction of cats can provide compelling evidence of their predatory impact. Cats have been introduced to 40 islands off the coast of Australia; seven off the coast of New Zealand and several dozen islands elsewhere in the Pacific (Dickman 1992a, Veitch 1985, King 1973 1984, in Dickman 1996). Feral cats have been implicated in the decline of at least six species of island endemic birds in New Zealand, including the Stephens Island wren, the sooty shearwater (Puffinus griseus) and the kakapo (Strigops habroptilus), as well as 70 local populations of insular birds (King 1984, in Dickman 1996). The elimination of cats often leads to an increase in the population size of prey species. For example, following removal of cats from Little Barrier Island, New Zealand, the stitchbird (Notiomystis cincta) increased from less than 500 individuals to 3000 individuals in just a few years (Griffin et al. 1988, in Dickman 1996).
Management Info

Cats were first domesticated in Egypt around 2000 BC (Serpell 1988, in Coleman et al. 1997, in Brickner 2003) and brought to Britain by 300AD by the Romans. European colonists introduced them around the globe (Coleman et al. 1997, in Brickner 2003). As cats are often revered as pets in our society this raises the moral dilemma of how to handle them when they have become a threat to native wildlife. Brickner (2003) suggests that animal rights organisations that condemn cat control via killing are overlooking the approximately 275 million animals killed by 9 million cats in Britain alone (Woods et al. in press). Obviously there are two quite different situations for management of the species, depending on the status of the cat: one is where a cat is a domesticated household pet and the other is when a cat has gone wild or feral and has no owner to protect and feed it.

When a cat is a pet, there are a number of ways in which to help prevent damage caused to wildlife. Brickner (2003) suggests keeping a cat in at night, fitting it with a bell, neutering the animal when it is young and giving it toys. However, the divided results of several investigations shows that the positive outcome of such actions is uncertain. Barrette (1998) found that fitting cats with bells has no significant effect on the amount of prey caught, whereas Ruxton et al. (2002) found that equipping cats with bells reduced prey delivery rates by about 50% (in Brickner 2003). Woods, McDonald and Harris (2003) found that the number of birds and herpetofauna brought home by cats was significantly lower in households that feed birds (but the number of actual different types of bird species killed was greater in households that feed birds). The number of mammals brought home per cat was lower when cats were equipped with bells or kept indoors at night, however, the number of herpetofauna brought home was greater when cats were kept in at night. The outcome of this is that there appears to be a subjective choice to be made as to whether it is more important to protect herpetofauna or mammals. Obviously, if the mammals being caught are introduced species, such as rats and mice, this raises another dilemma. In the second situation, when a cat is feral and threatening wildlife, a more severe means of controlling cats appears justified. In 1992 the Australian Parliament passed the Endangered Species Protection Act 1992, which obligates the commonwealth to provide a Threat Abatement Plan (TAP) for each listed threatening process, including one for feral cats (Brickner 2003). The key objectives of the feral cat TAP are: eradicate feral cats from islands where they threaten vulnerable native animals; prevent feral cats from occupying new islands where they may be a threat to native communities; promote the recovery of species threatened by feral cats; improve the effectiveness and humaneness of cat control methods and improve the understanding of the impacts of feral cats on native animals. The use of visual lures (such as feathers and cotton wool) and attractants (such as tuna oil) are currently being tested in an effort to attract greater numbers of feral cats to traps and baits. The impact of feral cats on native wildlife is being studied in various parts of Australia in order to have it quantified (Brickner 2003).

Predation by feral cats was listed as a Key Threatening Process under the Federal Endangered Species Protection Act 1992. A Threat Abatement Plan for Predation by Feral Cats was produced in 1999 and amended in 2008 to promote the recovery of vulnerable and endangered native species and threatened ecological communities (Environment Australia 1999 and DEWHA 2008). A recently published review (Denny and Dickman 2010) assesses the efficacy of the methods used to estimate relative abundance of cats; describes currently used cat control methodologies; and discusses possible future directions for the control of cats in Australia. It also includes details of the current legislative framework that exists for cat control in Australia; describes the ecology of feral and stray cats exploiting various habitats. Please follow this link to view Denny E. A & C. R. Dickman 2010. Review of cat ecology and management strategies in Australia.

Pathway

Many ships of the 18th and 19th centuries were infested with rats and so carried cats to control them. Taken by humans as pets then left behind or the young dispersed.

132 references found for Felis catus

Management information

Summary: Eradication case study in Turning the tide: the eradication of invasive species.

Summary: This report reviews available information on the adverse effects of 14 alien vertebrates considered to be significant invasive species on islands of the South Pacific and Hawaii, supplementing the author's experience with that of other workers.

Summary: This paper presents the results of a study into the prey composition for house cats in Canberra, Australia.

Summary: Eradication case study in Turning the tide: the eradication of invasive species.

Summary: This paper looks at the effectiveness of the trap/neuter/release methods used to control domestic cat colonies in the USA.

**Summary:** This paper considers the problem of domestic cat populations in natural areas in the USA.

**Summary:** Available from: [http://sisbib.unmsm.edu.pe/BRRevistas/biolgia/v17n2/pdf/a07v17n2.pdf](http://sisbib.unmsm.edu.pe/BRRevistas/biolgia/v17n2/pdf/a07v17n2.pdf) [Accessed 23 February 2011]

**Summary:** This paper discusses the interaction between wildcats and domestic cats in Scotland, and suggests management measures.

**Summary:** Galapagos Invasive Species: Harmful animals, 2004. Farewell to the airport cats: Eradication of feral cats from Baltra island.

**Summary:** This paper gives details of the eradications of introduced species in Europe, including the eradication of M. vison from Hiimmia Island in Estonia.

**Summary:** This paper gives details of the eradications of introduced species in Europe, including the eradication of M. vison from Hiimmia Island in Estonia.

**Summary:** Egg certain details of the eradications of introduced species in Europe, including the eradication of M. vison from Hiimmia Island in Estonia.

**Summary:** Eradication case study in Turning the tide: the eradication of invasive species.

IUCN 2010. IUCN Red List of Threatened Species. Version 2010.4

**Summary:** The IUCN Red List of Threatened Species provides taxonomic, conservation status and distribution information on taxa that have been globally evaluated using the IUCN Red List Categories and Criteria. This system is designed to determine the relative risk of extinction, and the main purpose of the IUCN Red List is to catalogue and highlight those taxa that are facing a higher risk of global extinction (i.e. those listed as Critically Endangered, Endangered and Vulnerable). The IUCN Red List also includes information on taxa that are categorized as Extinct or Extinct in the Wild; on taxa that cannot be evaluated because of insufficient information (i.e. are Data Deficient); and on taxa that are either close to meeting the threatened thresholds or that would be threatened were it not for an ongoing taxon-specific conservation programme (i.e. are Near Threatened).

**Summary:** Eradication case study in Turning the tide: the eradication of invasive species.

**Summary:** This compilation of information sources can be sorted on keywords for example: Baits & Lures, Non Target Species, Eradication, Monitoring, Risk Assessment, Weeds, Herbicides etc. This compilation is at present in Excel format, this will be web-enabled as a searchable database shortly. This version of the database has been developed by the IUCN SSC ISSG as part of an Overseas Territories Environmental Programme under funded project XOT603 in partnership with the Cayman Islands Government - Department of Environment. The compilation is work under progress, the ISSG will manage, maintain and enhance the database with current and newly published information, reports, journal articles etc.

**Summary:** Eradication case study in Turning the tide: the eradication of invasive species.

**Summary:** Eradication case study in Turning the tide: the eradication of invasive species.

This short note discusses the diet and home range of feral cats on Dassen Island, South Africa.

This study reports on the impacts of predators on the endangered Newell's shearwater on Kaua'I, Hawaii.

This article discusses the spread of the cat throughout mainland Australia and the early impact on native fauna.

This paper examines the impact of predation by domestic cats on wildlife in Great Britain.

Eradication case study in Turning the tide: the eradication of invasive species.

This database compiles information on alien species from British Overseas Territories.

This database compiles information on alien species from British Overseas Territories.

This database compiles information on alien species from British Overseas Territories.

This database compiles information on alien species from British Overseas Territories.

This database compiles information on alien species from British Overseas Territories.

This article discusses the spread of the cat throughout mainland Australia and the early impact on native fauna.

Summary: This paper examines the impact of cat predation in an urban area (Bristol, UK).

Summary: This article looks at the impacts of feral cats in the Poco das Antas Biological Reserve in Brazil.

Summary: This study looked at the impact of cat predation on a house sparrow population in a typical English village.

Summary: The species list sheet for the Mexican information system on invasive species currently provides information related to Scientific names, family, group and common names, as well as habitat, status of invasion in Mexico, pathways of introduction and links to other specialised websites. Some of the higher risk species already have a direct link to the alert page. It is important to notice that these lists are constantly being updated, please refer to the main page (http://www.conabio.gob.mx/invasoras/index.php/Portada), under the section Novedades for information on updates.

Invasive species - mammals is available from: http://www.conabio.gob.mx/invasoras/index.php/Especies_invasoras_-Mam%C3%ADferos [Accessed 30 July 2008]

Summary: This paper looks at the range of predators which feed on the endangered Hutton’s shearwater in New Zealand.

Summary: This article looks at the differences in the impacts of feral cats on introduced and endemic rodents in the Galapagos Islands.

Summary: Comprehensive overview of features of feral cats in Australia and their impact on native species.

Summary: This short paper looks at the history and diet of cats on Campbell Island, New Zealand.

Summary: This paper outlines the historical importance of mammals to Sao Tome and Principe.

Summary: This paper outlines the historical importance of mammals to Sao Tome and Principe.

Summary: This paper outlines the historical importance of mammals to Sao Tome and Principe.

Summary: This paper outlines the historical importance of mammals to Sao Tome and Principe.

Summary: Consequences to the biodiversity of New Caledonia of the introduction of plant and animal species.

Summary: This paper describes the pest management strategies which were undertaken at Trounson Kauri Park, New Zealand.

Summary: This paper examines the relationship between feral cats on Stewart Island and rats, their primary food source.

Summary: Available from: http://www.iucnredlist.org/apps/redlist/details/8833/0 [Accessed 1 February 2012]

Summary: This study reports on the impacts of predator control on the population of the Hawaiian petrel.

Summary: This study reports on the factors which are contributing to the endangered status of the Hawaiian dark-rumped petrel on Mauna Loa, Hawaii.

Summary: An online database that provides taxonomic information, common names, synonyms and geographical jurisdiction of a species. In addition links are provided to retrieve biological records and collection information from the Global Biodiversity Information Facility (GBIF) Data Portal and bioscience articles from BioOne journals.

Summary: This paper looks at the diet and impacts of feral cats on native animals on Okinawa Island, Japan.

Summary: This paper discusses the ecology of the feral cat on Macquarie Island.

Summary: This paper reports on the impacts feral cats are having on the seabird population of the Bonin Islands, Japan.

Summary: Description of various bird wildlife impacted by a domestic cat on Hahajima Island, Bonin Islands (Japan).

Available from: http://www.jstage.jst.go.jp/article/jos1/12/1_143/_article [Accessed 16 May 2006]

Summary: This paper looks at the causes of fledging mortality in the endangered black-fronted tern in New Zealand.

Summary: This paper reports on the changes in shearwater mortality on Natividad Island, Mexico, following cat eradication.

Summary: This chapter reports on the predation by cats on storm petrels in the Molene Archipelago, France.

Global Invasive Species Database

Full Account for: *Felis catus*

**Summary:** This paper presents the findings of video recordings of the nests of the endangered palilla, in Hawaii.

**Summary:** This paper examines the impacts of introduced mammals such as feral cats on breeding seabird populations in the California Channel Islands and the Northwestern Baja California Islands.

**Summary:** The authors outline the threats to the European wildcat in Scotland, including hybridisation with domestic cats.

**Summary:** This newspaper article reports on an outbreak of salmonella among feral cats in Oregon, USA.

**Summary:** This paper discusses the diet of feral cats in central Australia.

**Summary:** This paper discusses the distribution of introduced mammals in New Caledonia's southern nature reserves.

**Summary:** This paper discusses the diet of feral cats in central Australia.

**Summary:** This paper discusses the distribution of introduced mammals in New Caledonia's southern nature reserves.

**Summary:** This paper examines the impacts of introduced species such as feral cats on the San Clemente Island, California.

**Summary:** Synthèse des introductions d'espèces de vertébrés en Nouvelle-Calédonie et évaluation de leurs impacts.

**Summary:** This paper discusses the distribution of introduced mammals in New Caledonia's southern nature reserves.

**Summary:** This paper discusses the distribution of introduced mammals in New Caledonia's southern nature reserves.

**Summary:** This paper discusses the distribution of introduced mammals in New Caledonia's southern nature reserves.

**Summary:** This paper discusses the diet of feral cats in central Australia.

**Summary:** This paper examines the causes for mortality of wild and released grey partridges in Finland.

**Summary:** This paper discusses the distribution of introduced mammals in New Caledonia's southern nature reserves.

**Summary:** This paper looks at the causes of mortality for a range of ground-nesting birds in the Upper Waitaki Basin in New Zealand's South Island.

**Summary:** This study provides estimates of the population size of cats on Kerguelen Island.

**Summary:** This study examines the causes for mortality of wild and released grey partridges in Finland.

**Summary:** This study looks at the home range and diet of feral cats in Hawaiian forests.

**Summary:** This study examines the causes for mortality of wild and released grey partridges in Finland.

**Summary:** This study examines the causes for mortality of wild and released grey partridges in Finland.

**Summary:** This paper discusses the ecological impacts of cat predation on the Balearic Islands.

**Summary:** This paper discusses the ecological impacts of cat predation on the Balearic Islands.
UAE Interact. Undated a. The Islands - Arzanah  

**Summary:** Information on wild cats.  

Urtizberea, pers.comm., 2007  
**Summary:** Personal communication with Frank Urtizberea, from the Direction de l'Agriculture et de la Foret.

**Summary:** This paper reports on the release of the Aldabra rail on to Aldabra Atoll in the Seychelles.

**Summary:** This paper examines the relationship and potential for competition between feral cats and the Iriomote cat on Iriomote Island, Japan.

Watling, D., 2001. A Survey Of The Terrestrial Vertebrate Fauna Of NanuyalevU (Turtle Island), Yasawa, Ba  
**Summary:** Available from: http://www.pacificbirds.com/nanuyalevutrip1.html [Accessed Feb 15 2005]

**Summary:** This study looked at the impact of feral cat predation on a population of black redstarts in Switzerland.
