

Ailanthus altissima [简体中文](#) [正體中文](#)

System: Terrestrial

Kingdom	Phylum	Class	Order	Family
Plantae	Magnoliophyta	Magnoliopsida	Sapindales	Simaroubaceae

Common name Chinese sumac (English), tree-of-heaven (English, USA), stinking shumac (English)

Synonym

Similar species *Carya illinoensis*, *Rhus typhina*, *Juglans nigra*

Summary

Ailanthus altissima is a very aggressive plant, a prolific seed producer (up to 350,000 seeds in a year), grows rapidly, and can overrun native vegetation. It also produces toxins that prevent the establishment of other plant species. The root system is aggressive enough to cause damage to sewers and foundations.

Species Description

Ailanthus altissima is a small to medium-sized tree of the mostly tropical Quassia family. It has a smooth, grey bark with compound leaves which are alternate, odd-pinnate, with 11-25 lanceolate leaflets. Most leaflets have one to three coarse teeth near their base. Mature trees can reach 24 metres or more in height. Flowers occur in panicles at the ends of branches and the male flowers produce a strong odour, described as the smell of burnt peanut butter. The leaves, when crushed, also produce a distinctive odour. Seeds are centred in a papery sheath called a samara. The samaras are slightly twisted or curled and twirl as they fall to the ground. The wood of *Ailanthus altissima* is soft, weak, coarse-grained, and creamy white to light brown in colour.

Notes

Male flowers are conspicuous and ill smelling, attracting many insects. Female flowers are less odorous and less conspicuous.

Lifecycle Stages

Established trees produce numerous suckers from the roots and sprout vigorously from cut stumps and root fragments. Seedlings establish a taproot three months after germination. *A. altissima* probably lives for no more than 100 years in North America (usually less) but the root system and its sprouts can persist for a longer time.

Uses

The wood is often used in China for lumber, fuelwood and other products. In the U.S. it is occasionally used for low-grade lumber, pulpwood and fuelwood. The toxin produced in the bark and leaves of *A. altissima* is being studied as a possible source for a natural herbicide. It is used in traditional herbal medicine in China.

Habitat Description

Ailanthus altissima establishes itself readily on disturbed sites, such as railroad embankments, highway medians, fencerows, and roadsides. In naturally forested areas, *A. altissima* may become established in areas disturbed by storms or infestations. *A. altissima* has the ability to grow in poor soils and under stressful environmental conditions. It grows in full sun and thrives in poor growing conditions. Germination rates are high, provided soil has adequate moisture. It is well adapted to heavy clays and other soils with low nutrient and oxygen content.

Reproduction

Ailanthus altissima reproduces both sexually (seeds) and asexually (vegetative sprouts). Flowering occurs late in the spring (June in the middle Atlantic region of eastern United States). The species is dioecious (trees have either male or female flowers). A single tree can produce around 325,000 to 350,000 seeds a year. Trees grow quickly, as stump sprouts grow up to 3cm per day.

Nutrition

Ailanthus altissima is well adapted to heavy clays and other soils with few nutrients.

General Impacts

All over the United States, *Ailanthus altissima* has become a pest of agricultural, urban and forested areas. Seedlings and root suckers of *A. altissima* grow rapidly and spread prolifically and thus quickly out-compete many native species for sunlight and space. It also produces a toxin in its bark and leaves. As it accumulates in the soil, the toxin inhibits the growth of other plants. The root system is capable of damaging sewers and foundations.

Management Info

Preventative measures: A Risk assessment of *Ailanthus altissima* for Australia was prepared by Pacific Island Ecosystems at Risk (PIER) using the Australian risk assessment system (Pheloung, 1995). The result is a score of 12 and a recommendation of: reject the plant for import (Australia) or species likely to be a pest (Pacific).
