

***Monopterus albus*** 正體中文

**System:** Freshwater

Kingdom	Phylum	Class	Order	Family
Animalia	Chordata	Actinopterygii	Synbranchiformes	Synbranchidae

**Common name** white ricefield eel (English), swamp eel (English), rice eel (English)

**Synonym** *Fluta alba* , (Bloch and Schneider, 1801)

**Similar species**

**Summary** Although its impacts are unknown, *Monopterus albus*' predaceous and generalised feeding habit poses a potential threat to native fish, frogs and aquatic invertebrates. In Florida and Georgia, introduction is likely due to an aquarium release or a fish farm escape or release. It is believed that *Monopterus albus* was originally brought to Hawaii by Asian immigrants as a food fish.

[view this species on IUCN Red List](#)

**Species Description**

Aguirre and Poss (1999) state that the body of *M. albus* is more or less cylindrical; the tail is compressed, tapering to a slender point much shorter than the trunk. Scales are absent. The snout is bluntly rounded, and the jaws and palate have rows of viliform teeth. The upper lip is thick overlapping part of the lower lip. The eye is small, covered by a layer of skin. Body colour is slate brown above and white to light-brown below with small, dark spots on its sides and occasionally on the ventral surface. *M. albus* may grow to a metre in length, but most grow to between 25cm and 40cm.

**Uses**

According to Bricking (2002), in Asia, *M. albus* are considered a food fish, and a delicacy. They are also found in markets as food in the United States, as well as in pet supply stores, although they are not as well known.

**Habitat Description**

Bricking (2002) states that *M. albus* lives in muddy ponds, swamps, canals, and rice fields, where it burrows in moist earth in the dry season, surviving for long periods without water.

**Reproduction**

According to Aguirre and Poss (1999), *M. albus* eggs are laid into a bubble nest in shallow water. The nest is typically not attached to vegetation but floats freely at the surface. One or both parents guard the eggs and young.

**Nutrition**

Bricking (2002) states that *M. albus* are nocturnal generalized predators (carnivores) that devour fishes, worms, crustaceans, and other small aquatic animals.

## General Impacts

According to Bricking (2002), the impacts of *M. albus* are uncertain, however, they are likely to affect the population size of their prey, as well as the availability of food sources for larger fish, turtles, frogs and wading birds. *M. albus* consumes crayfish, tadpoles, small fish, and worms. They can eat some larger prey as well, by grabbing them with their mouths, and spinning until they are torn in half. *M. albus* may also play a role in altering the habitat beneath ponds and marshy regions where they burrow nests to wait out dry seasons. Declines in native centrarchids from some areas of the United States have been attributed to this species (Nico, 1999).

## Pathway

*M. albus* was originally brought to Hawaii by Asian immigrants as a food fish, and purposely released into the wild (Bricking, 2002).

Trinational Risk Assessment Guidelines for Aquatic Alien Invasive Species. Commission for Environmental Cooperation. 393, rue St-Jacques Ouest, Bureau 200, Montréal \(Québec\), Canada. ISBN 978-2-923358-48-1.](#)

**Summary:** In 1993, Canada, Mexico and the United States signed the North American Agreement on Environmental Cooperation (NAAEC) as a side agreement to the North American Free Trade Agreement (NAFTA). The NAAEC established the Commission for Environmental Cooperation (CEC) to help the Parties ensure that improved economic efficiency occurred simultaneously with trinational environmental cooperation. The NAAEC highlighted biodiversity as a key area for trinational cooperation. In 2001, the CEC adopted a resolution (Council Resolution 01-03), which created the Biodiversity Conservation Working Group (BCWG), a working group of high-level policy makers from Canada, Mexico and the United States. In 2003, the BCWG produced the Strategic Plan for North American Cooperation in the Conservation of Biodiversity. This strategy identified responding to threats, such as invasive species, as a priority action area. In 2004, the BCWG, recognizing the importance of prevention in addressing invasive species, agreed to work together to develop the draft CEC Risk Assessment Guidelines for Aquatic Alien Invasive Species (hereafter referred to as the Guidelines). These Guidelines will serve as a tool to North American resource managers who are evaluating whether or not to introduce a non-native species into a new ecosystem. Through this collaborative process, the BCWG has begun to implement its strategy as well as address an important trade and environment issue. With increased trade comes an increase in the potential for economic growth as well as biological invasion, by working to minimize the potential adverse impacts from trade, the CEC Parties are working to maximize the gains from trade while minimizing the environmental costs.
