

Spathodea campanulata  [简体中文](#) [正體中文](#)

System: Terrestrial

Kingdom	Phylum	Class	Order	Family
Plantae	Magnoliophyta	Magnoliopsida	Scrophulariales	Bignoniaceae

Common name Afrikanischer Tulpenbaum (German), tulipan africano (Spanish), amapola (English, Dominican Republic), baton du sorcier (French), flame of the forest (English), pisse-pisse (French), tulipier du Gabon (French), fountain tree (English), fireball (English), taga mimi (English, Fiji), tiulipe (English, Tonga), tuhke dulip (English, Pohnpei), rarningobchey (English, Yap), Indian Cedar (English), apär (Carolinian, CNMI), mata kō'ī'i (Cook Islands, Cook Islands), mimi (Cook Islands, Cook Islands), patiti vai (Cook Islands, Cook Islands), pititi vai (Cook Islands, Cook Islands), Santo Domingo Mahogany (English), African tulip tree (English), orsachel kui (English, Palau), fa'apasī (Samoan, Samoa), ko'i'i (Cook Islands, Cook Islands)

Synonym *Spathodea danckelmaniana* , Buettner
Spathodea nilotica , Seem.
Spathodea tulipifera , (Thonn.) G.Don

Similar species

Summary The African tulip tree (*Spathodea campanulata*) is an evergreen tree native to West Africa. It has been introduced throughout the tropics, and, has naturalised in many parts of the Pacific. It favours moist habitats and will grow best in sheltered tropical areas. It is invasive in Hawaii, Fiji, Guam, Vanuatu, the Cook Islands and Samoa, and is a potential invader in several other tropical locations.

[view this species on IUCN Red List](#)

Species Description

The African tulip tree is described as follows a "large tree with a stout, tapering often somewhat buttressed trunk, branches thickish, marked with small white lenticels, subglabrous to thinly puberulent, reaches heights of 25 m; leaves usually opposite (rarely 3 at a node), very widely diverging, up to 50cm long, (7-) 11-15 (-17) leaflets broadly elliptic or ovate, entire, to 15 x 7.5cm, with 7-8 principal veins on each side, puberulent and prominent beneath, apex very slightly acuminate, base somewhat asymmetrically obtuse, lower leaflets tending to be reflexed, petiolule short, 2-3mm, rachis nearly straight, brownish-puberulent, petiole up to 6cm long, thickened at base; raceme 8-10cm long on a peduncle of about the same length, with a pair of reduced leaves about halfway up, rachis and pedicels thick, brownish puberulent, bracts subtending pedicels lanceolate, curved, about 1cm long, caducous, pair of bractlets near summit of pedicel similar, opposite; calyx strongly curved upward, asymmetric, about 5cm long, tapering, somewhat ribbed, splitting at anthesis to within a fewmm of base along dorsal curve, apex horn-like, blunt, exterior brownish sericeous puberulent; corolla bright vermilion or scarlet, 10-12cm long, mouth of limb about 7cm across, lobes about 3cm long, obtuse, margins strongly crispate, orange-yellow; filaments about 5cm long, dull orange anthers arcuate, linear, very dark brown, 15mm long; style yellow, 8cm long, stigma reddish; capsule lanceolate, slightly compressed, 17-25 x 3.5-7cm" (Fosberg *et al*, 1993, in PIER, 2002).

Notes

The trunks and limbs of the African tulip tree are weak and don't stand up to typhoons very well, branches also break off easily as the tree gets older (PIER, 2002). The seedlings establish rapidly and the tree grows quickly, making it one of the first trees to colonise wastelands (Tan, 2001).

Uses

The seeds are edible. In Singapore the timber is used for making paper. In West Africa the wood is used to make drums and blacksmith's bellows. The bark, flowers and leaves are also used in traditional medicine in its native home range. (Tan, 2001)

The wood is difficult to burn and so the tree can be used in fire resistant landscaping. Buds contain liquid that will squirt out if they are squeezed or pierced, which children enjoy using as water pistols. African hunters are said to have boiled the seeds to extract arrow poison. (Floridata.com L.C. Copyright 1996 - 2002)

Habitat Description

The African tulip tree invades both abandoned agricultural land and closed forest; it invades natural ecosystems in the Cook Islands, Fiji, Guam, Hawai'i, Samoa and Vanuatu (PIER, 2002; Labrada, pers.comm. 25 February 2003). Although the African tulip tree favours moist and wet areas below 1000m (Smith, 1985, in PIER, 2002), it grows up to 1,200m in French Polynesia (PIER, 2002).

The tulip tree does not tolerate frost and demands full sun for fast growth and best flowering. The biggest trees grow in moist sheltered ravines. This species loves rich soil, but puts up with just about anything with a little fertility to it, including limerock. It will survive a bit of salinity. (Floridata.com L.C. Copyright 1996 - 2002)

Reproduction

The flowers are pollinated by birds and bats and the seed is dispersed by the wind (Floridata.com L.C. Copyright 1996 - 2002). This plant is also capable of propagating by root suckers and cuttings (PIER, 2002), as well as by seed in cultivation. Each seed pod contains about 500 tissue papery seeds, (Floridata.com L.C. Copyright 1996 - 2002).

General Impacts

The African tulip tree invades agricultural areas, forest plantations and natural ecosystems, smothering other trees and crops as it grows becoming the prevailing tree in these areas (Labrada, pers.comm. 25 February 2003). In Hawaii, there are major infestations tucked away in almost every rainforest valley along the northern and eastern slopes of Kaua'i, O'ahu, and East Maui (Smith, Hawai'ian Alien Plant Studies).

Management Info

Preventative measures: A [Risk Assessment of *Spathodea campanulata*](#) for Haaii and other Pacific Islands was prepared by Dr. Curtis Daehler (UH Botany) with funding from the Kaulunani Urban Forestry Program and US Forest Service. The alien plant screening system is derived from Pheloung *et al.* (1999) with minor modifications for use in Pacific islands (Daehler *et al.* 2004). The result is a high score of 14 and a recommendation of: "Likely to cause significant ecological or economic harm in Hawai'i and on other Pacific Islands as determined by a high WRA score, which is based on published sources describing species biology and behaviour in Hawai'i and/or other parts of the world."

Please follow this link to view and read [Auld and Nagatalevu-Seniloli, 2003. African tulip tree in the Fijian Islands](#) for management options.

Pathway

Widely introduced throughout tropical and subtropical regions of the world as an ornamental and street tree. (Labrada, 25 February 2003, pers.comm.)
