

MV (Massive) | *Hyla intermedia*

Date assessed	2020-12-05
Year published	2021
Eicat category	MV (Massive)
Justification for EICAT assessment	The hybridisation between the introduced <i>H. intermedia</i> and the endangered <i>H. arborea</i> is common in the impacted region (with the paper claiming that all individuals in the impacted population are hybrids, Dufresnes et al. 2015). As such this represents a decline, or potential extinction, of the genetically pure population of the <i>H. arborea</i> . The paper does note, however, that the native population of the endangered <i>H. arborea</i> may be recovered with increased human effort if <i>H. intermedia</i> were to be removed.
Confidence rating	Low
Mechanism(s) of maximum impact	Hybridisation
Countries of most severe impact	Switzerland
Description of impact	Hybridisation- <i>Hyla intermedia</i> has been reported to hybridize with the endangered European Tree Frog (<i>H. arborea</i>), thereby causing an extirpation of the genetically pure population of native <i>H. arborea</i> .
