

## **GLOBAL INVASIVE SPECIES DATABASE**

EICAT profile: Acridotheres cristatellus

## MN (Minor) Acridotheres cristatellus

Date assessed 2021-09-20 Year published 2022 MN (Minor) **Eicat category Justification for EICAT** assessment The Crested Myna does not seriously affect other birds, except in the case of the species it wishes to dispossess of nesting sites. They have been reported to evict birds from their nests and destroying or tossing out young and eggs af American robins (Turdus migratorius), Yellow-shafted Flicker (Colaptes auratus) and other native species. There is no evidence that this has caused a decline of these species (Cottam and Scheffer, 1935). Confidence rating Iow Competition; Predation Mechanism(s) of maximum impact **Countries of most severe** Canada; U.S.A. impact The Crested Myna competes with native bird species in North America and Portugal. It has also been Description of impact observed destroying young and eggs of native bird species. Thomas Evans; Tom Allmert **Assessor Contributors** Reviewers EICAT authority Recommended citation Thomas Evans; Tom Allmert. (2025). Acridotheres cristatellus . <u>IUCN Environmental Impact Classification</u> for Alien Taxa (EICAT).
