

GLOBAL INVASIVE SPECIES DATABASE

EICAT profile: Acacia decurrens

MO (Moderate); MR (Major)Acacia decurrens

Date assessed 2020-09-27 2023 Year published MO (Moderate); MR (Major) **Eicat category Justification for EICAT** assessment It was noted that Acacia decurrens Willd. invaded the park and threatened the cork oak ecosystem (Beddiar et al., 2012). Results showed the negative effect of acacia on cork oak growth, its mycorrhizal status as well as on the morphotypic diversity of its ectomycorrhizae. The plant and fungal biodiversity decreased significantly in the sites invaded by this acacia species. A. decurrens homogenized invaded areas and was found to have the ability to inhibit and compete with native species (Afrianto et al., 2010). **Confidence rating** Structural Impact on ecosystem; Chemical impact on ecosystems Mechanism(s) of maximum impact **Countries of most severe** Indonesia; Algeria impact **Description of impact** Only one major and one moderate impact. 3 DD impacts mainly because soil properties impacted but no measure on how it affects native species. Acacia decurrens competes with native species. Structurally impacts environment through homogenisation. Chemical impact leads to decreased plant and fungal biodiversity.
